ENGINEERING DATA

SHINKO marine centrifugal pumps have been designed and manufactured in accordance with the Japanese Marine Equipment Association's standards for high performance under the following operating conditions:

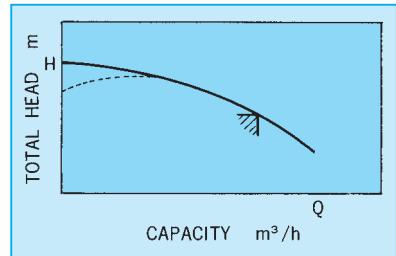

- Temperature : Maximum ambient temperature : 50°C
 : Maximum cooling sea water temperature : 32°C
- List and rolling of the ship : 15 degrees horizontally, 10 degrees longitudinally, and 22.5 degrees for one side rolling.
- Installation direction : The shafts for the horizontal pumps are to be installed parallel to the keel. The shafts for the vertical pumps are to be installed vertically to the keel.

■ DESIGN & FUNCTIONS

● H-Q CURVE

All pumps are designed in such a way that the H-Q curve descends to the right in a continuous line as shown in the figure on the right. At any of the points above the H-Q curve, shaft horsepower does not exceed motor output.

However, some specific pumps such as boiler feed pumps, condensate pumps, and drinking water pumps or sanitary pumps for hydrophore units, are operated within a specific range upon which the motor output is selected. Hence, shaft horsepower beyond this specific range may exceed the motor output.

● BALL BEARINGS & LUBRICATION

The vertical models SA, SB, CVF, EVZ, and all horizontal pumps except the model HJ are equipped with heavy duty deep groove (63 type) ball bearings or angular contact (73 type) ball bearings with a life of more than 60,000 hours.

Sealed ball bearings are applied to small pumps. Whereas, all other pumps use grease lubrication or oil lubrication. For oil lubrication, either an oil bath or an oil ring is employed to lubricate. And, an oil level gauge is located on the bearing housing.

Service	Model	Lubrication
Horizontal small size pump	AHJ, SHQ, GJ	Sealed ball bearing
BW circulating pump	BT	Oil bath
Lubricating oil pump	SA	Oil handled
Other pumps	Other models	Grease

During the shop test, attention has been paid to the bearing temperature of electric-motor-driven pumps to ensure that they do not exceed the ambient temperature by 40°C or liquid temperature by 20°C whichever is higher, and do not exceed 75°C in summer.

● LINE BEARING & LIQUID LUBRICATION

We have experienced many troubles to do with the lower side bearings such as water leakage from the stuffing box causing the ball bearings to get rusty in the vertical pumps. And, with our standard pumps, the lower bearings are equipped with a line bearing where water lubrication is applied utilizing a pump discharge liquid.

The line bearing is also applied to the casing and intermediate shaft bearings of the tank mounting pumps (the models SA and SB). The PV value of the line bearing has been designed to be less than 2 MPa-cm/sec.

● VIBRATION

Consideration has been given to the design of the pump construction and the impellers to reduce vibration as much as possible.

The maximum tolerance for pump vibration during shop test is shown on the table on the right.

Horizontal	Below 500m³/h	4.0mm/s
	Over 500m³/h	4.0mm/s
Vertical	Below 500m³/h	3.3mm/s
	Over 500m³/h	5.3mm/s

● NOISE

Consideration has been given to the design of the pump casings and the impellers to reduce as much noise as possible as with vibration.

The permissible value of the noise in the shop to be less than 100 dB (A), when measuring at 1 m distance from the pump operated at rated condition.

● PRESSURE GAUGE & ROOT VALVE

To indicate pump suction pressure and discharge pressure, 75 mm diameter gauges are fitted onto a gauge stand for horizontal pumps or onto a gauge board for vertical pumps. Connection to the gauges is made via 6mm outer diameter copper pipes with root gauge valves on the pump side, and gauge joints on the gauge side.

Service	Model	Suc.	Disch.
Boiler water circ. pump	BT	PG	PG
Hot water circ. pump	HJ	PG	PG
Condensate pump	RVZ, RVE	CG	CG
D.trans. LO pump	SB, SA	—	PG
Other pumps	Others	CG	PG

PG:Pressure G. CG:Compound G.

● COUPLING COVER

A coupling cover is provided for the pumps for safety.

● AIR VENT VALVE

At the highest point of the pump casing, a hole is provided to allow the air to vent, and an air vent valve is installed

■ STUFFING BOX SEAL

A stuffing box is located on the pump casing where the impeller shaft passes through and the gland packing is installed as a standard feature. However, a mechanical seal can be installed alternatively at customer request.

● GLAND PACKING

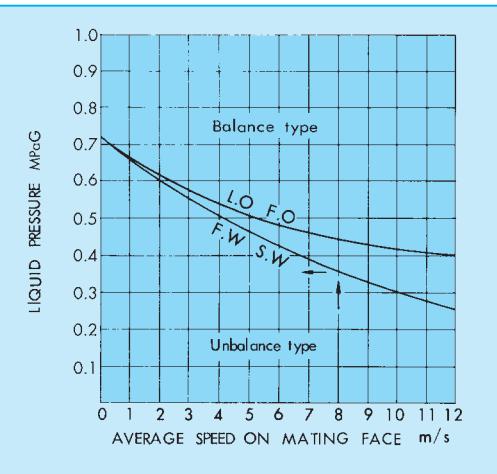

Gland packing shown on the table on the right is a standard feature depending on the model and use of the pump.

Service	Model	Stuff. box seal
Boiler feed pump	GHQ, SK, DK	NON-ASBESTOS FIBER
Lubricating oil pump	SA	Oil seal
BW circulating pump	BT	Throttle bush + Carbonized fiber
Other pumps	Others	Carbonized fiber

● MECHANICAL SEAL

Depending on the liquid pressure in the stuffing box and the peripheral speed on the mating face, there are two types of mechanical seals, balanced and unbalanced. And, the selection can be made using the curve on the chart shown on the right, provided that the temperature of the liquid handled remains within the following limits:

Fresh water pumps : Max. 70°C
 (Max. 80°C if the shaft diameter is below 60mm)
 Sea water pumps : Max. 40°C
 LO and FO pumps : Max. 80°C

● BALANCED MECHANICAL SEAL

For the model SB tank mounting drain transfer pumps, the stuffing box pressure reaches the discharge pressure during operation owing to its own design, and the standard revolution is either 3000 or 3600 min⁻¹. When installing a mechanical seal to this model, a balanced mechanical seal is employed.

The upward force affecting the mating face of the mechanical seal can be calculated using the following formula:

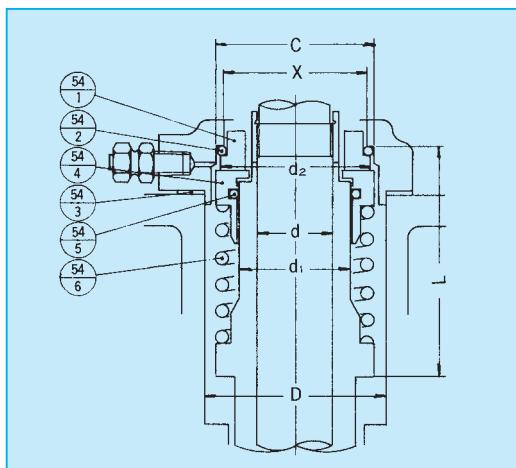

$$\pi /4(d_2^2 - d_1^2) \times 10P + F$$

d₂ : Outer diameter of the floating seat (cm)

d₁ : Outer diameter of the sleeve (cm)

P : Liquid pressure in the stuffing box (MPaG)

F : Spring tension (kg)

d	D	L	C	X	SEALOL (USA)
50	80	85.5	70.99	66	1501-50

54-1	FLOATING SEAT	1	CARBON	
-2	PACKING RING	1	RUBBER	
-3	PACKING	1	GASKET	
-4	SEAL RING	1	STAINLESS STEEL	SUS316
-5	PACKING RING	1	RUBBER	
-6	SPRING	1	STAINLESS STEEL	SUS316

● UNBALANCED MECHANICAL SEAL

All pumps employ unbalanced mechanical seals except the following models: SA employs oil seals, BT-4 employs bellow style balanced mechanical seals, and both SB and DK 80-10 employ mono-coil-spring balanced mechanical seals. The seals shown in the figure on the right are fitted if customer requests a mechanical seal.

Upward force affecting the mating face of the mechanical seal can be calculated using the following formula same as that of the balanced mechanical seal.

$$\pi /4(d_2^2 - d_1^2) \times 10P + F$$

d_2 : Outer diameter of the floating seat (cm)

d_1 : Outer diameter of the sleeve (cm)

P : Liquid pressure in the stuffing box (MPaG)

F : Spring tension (kg)

d_1	D	L	C	X	JAPANESE	SEALOL (USA)	FLEXIBOX (ENGLAND)
30	53	50.8	44.45	38.61	US-2-30	30-15M5	R-3000M
35	60	57.15	49.2	43.46	US-2-35	35-15M5	R-3500M
40	65	57.15	53.97	43.13	US-2-40	40-15M5	R-4000M
50	80	68.26	65.07	59.33	US-2-50	50-15M5	R-5000M
60	90	73.02	76.2	70.36	US-2-60	60-15M5	R-6000M
75	105	80.96	90.47	84.73	US-2-75	75-15M5	R-7500M

These mechanical seals are interchangeable as a complete set.

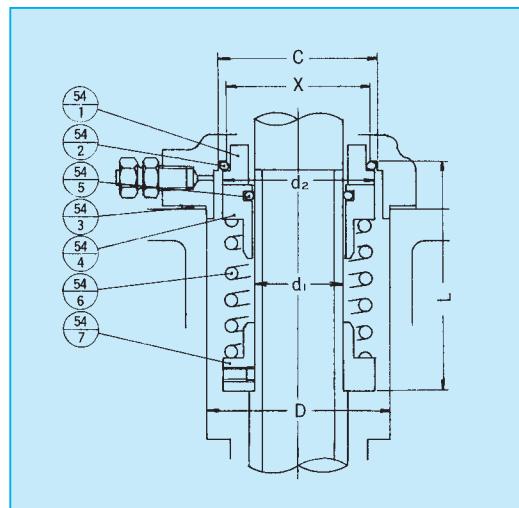

● FLUSHING

Flushing liquid is supplied to both balanced and unbalanced mechanical seals in order to cool, wash, and lubricate the mating face. The quantity of the flushing liquid is determined by the peripheral speed of the mating face (shaft diameter) of the mechanical seal shown in the table on the right.

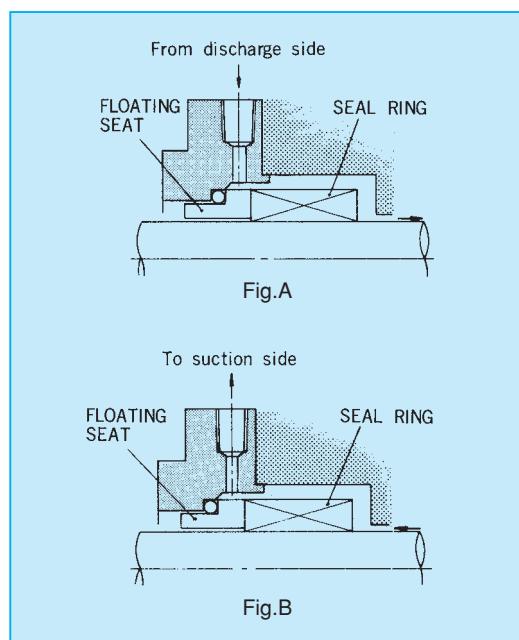

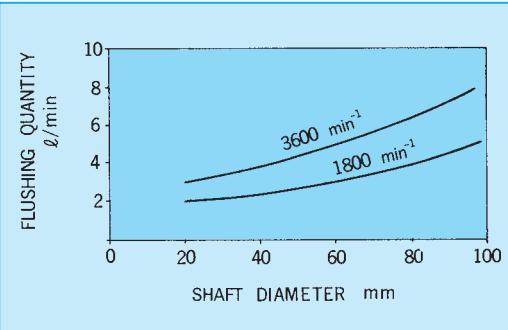

There are two methods to supply the flushing liquid to the mating face of the mechanical seal according to the construction of the pump as follows:

Figure A is applicable in the case that the liquid pressure in the stuffing box is negative, and the flushing liquid is cycled to the stuffing box from the discharge side of the pump.

Figure B is applicable in the case that the liquid pressure in the stuffing box is positive, and the flushing liquid is cycled to the suction side of the pump from the stuffing box.

■ SELF PRIMING DEVICE

Pumps can be equipped with a self priming device upon customer request.

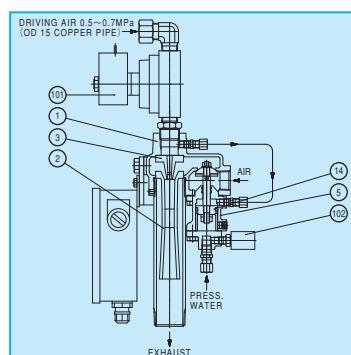

There are two kinds of self priming devices. One is an air ejector which is standard, and the other is a vacuum pump which is equipped in emergency fire pumps which require no pneumatic source.

1. AIR EJECTOR

The photo on the right shows a vertical pump with an air ejector, used in self-priming devices. The ejector unit consists of an ejector casing(1), a diffuser(2), a nozzle(3), a cylinder(5), a solenoid valve(101), a pressure switch(102), and other minor parts.

The following two standard models are available for use in vertical and horizontal pumps in accordance with the SM Standards (Japanese Marine Equipment Association's Standards):

Model	Max. Vacuum MPa	Max. amount of extraction m³/h	Driving Air MPa × m³/h	Application Suc. Dia Mm
AEJ 70	-0.08	42	0.6 × 80.5	Below 200
AEJ 110	-0.08	66	0.6 × 101.5	Over 250

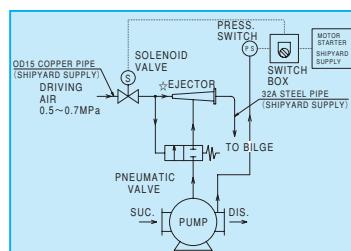

● OPERATION

A combination of the diffuser(2) and the nozzle(3) create a vacuum with an ejecting function using driving air between 0.55~0.7 MPa. The piston(14) in the cylinder(5) is pushed downward by the driving air, forcing the port between the pump casing and the ejector casing(1) to open. Eventually, the air inside the pump and pipes is extracted.

While the main pump is in operation, the pump casing is filled with pumping liquid. And, the discharge pressure rises by extracting the air from the pump and pipes. The pressure switch(102) is activated by the pressure rise, making the solenoid valve(101) stop the driving air. The piston(14) in the cylinder(5) is pushed upward by the pump discharge pressure along with spring force to shut the passage between the pump and the ejector casing.

PART NO	NAME OF PART	Q'TY
1	EJECTOR CASING	1
2	DIFFUSER	1
3	NOZZLE	1
5	CYLINDER	1
14	PISTON	1
101	SOLENOID VALVE	1
102	PRESSURE SWITCH	1

When priming is completed, the pump enters normal operation mode. At this time, the driving air can be stopped by the solenoid valve when discharge pressure is detected by the pressure switch.

2. VACUUM PUMP

The photo on the right shows the vertical pump with an attached vacuum pump to work as a self priming pump.

The self priming device consists of a vacuum pump, a clutch, a hydraulic piston, an auto valve, a separate tank, and piping.

According to the SM Standard (Japanese Marine Equipment Association's standard), the following two standard models are available for vertical and horizontal pumps.

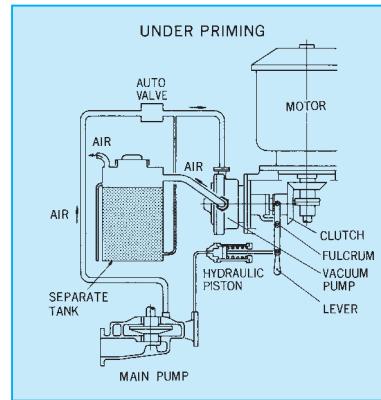

Model	Max. Vacuum MPa	Max. amount of extraction m³/h	SHP kW	Application
VND 150	-0.08	20	3.7	All vert.pump
VND 200	-0.08	50	3.7	All vert.pump

● OPERATION

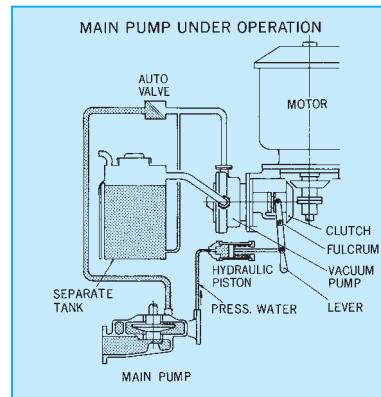

While the main pump is standing still, the clutch is engaged by the spring force of the hydraulic piston. When the main pump is started, the vacuum pump is driven via a clutch and the air in the main pump casing is extracted through the auto valve. The mixture of air and water is discharged to the separate tank and only the air is discharged to the atmosphere.

At the completion of the priming of the main pump, discharge pressure acts on the hydraulic piston and the clutch is disengaged automatically. Then, the main pump begins normal operation.

While the main pump is in operation, the priming pipeline between the main pump and the vacuum pump is completely closed by the auto valve, regardless of whether the suction of the main pump is positive or negative.

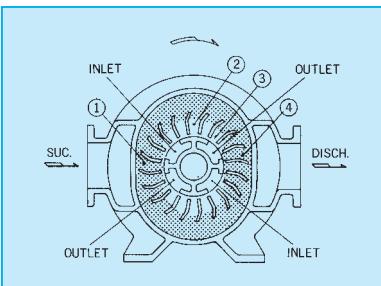

Owing to this process, the handling liquid does not leak from the main pump on the way to the separate tank.

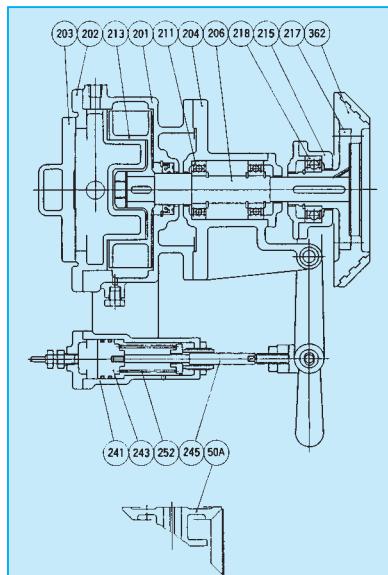

● DESIGN & FUNCTIONS

As shown in the figure on the right, the vacuum pump consists of a runner with blades curved in the direction of rotation, and an oval shaped casing which has each two inlet and outlet ports.

It is necessary to fill the water in the casing up to half level prior to starting the pump. When started, the water in the casing forms a water film in an oval shape alongside the interior wall of the casing through centrifugal force. That is to say, chamber ① is filled with water, then when it rotates, the water film moves outward by the centrifugal force alongside the casing wall and sucks the air from the inlet port. In chamber ②, the water film moves outward and it is filled with air. In chamber ③, the water film gradually moves inward then the air is compressed and discharged from the outlet port. In chamber ④, it is filled with water again and repeats the cycle.

252	SPRING	1	PHOSPHOR BRONZE	
362	CLUTCH FACING	1	SYNTHETIC RESIN	

● AUTO VALVE

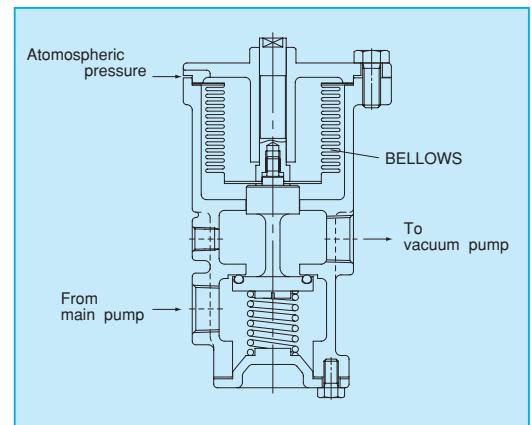

One side of the auto valve is connected to the priming port of the main pump and the other side is connected to the inlet of the vacuum pump by piping.

When the vacuum pump is standing still, the auto valve is locked into the closed position from the force of the lower spring.

When the priming starts at the start up of the vacuum pump, the internal pressure of the auto valve falls below the atmospheric pressure, and this pressure pushes the auto valve open via bellows.

When the priming is completed and the vacuum pump stops running, the internal pressure of the auto valve returns to atmospheric pressure and it balances the pressure in the bellows. Then, the auto valve is closed from the force of the lower spring.

When the suction pressure is positive, the vacuum pump does not start. So, the auto valve closes automatically from the force of the lower spring.

● LUBRICANTS

The lubricants for the ball bearings fitted on the pumps are either grease or oil, depending on the pump's design.

NLGI No.2 (National Lubricating Grease Institute) for grease and ISO VG68 (International Standard Organization) for oil are recommended. The brands of grease and oil suitable for those lubricants are shown in the following table:

NAME OF COMPANY	GREASE	LUBRICATING OIL	GEAR OIL

■ SEA WATER PUMPS (Continuous use)

For continuous-use sea water pumps such as cooling sea water pumps, a zinc anode is better fitted in the casing as an option. A material combination of a stainless steel impeller (SCS14) and a synthetic resin mouth ring are also recommended at extra cost.

When applying polyethylene lining or equivalent for the protection of pipe lines, it is necessary to install either a short pipe (about 200~300mm) with the zinc anode or a sacrificing pipe (bare steel) at the suction side of the pump.

As for pumps except the models SVA, SVB and CVF, it is necessary to apply the aforementioned measures as the zinc anode cannot be fitted on its own due to the design of the pumps.

■ MAIN CONDENSATE PUMPS & TURBO-GENERATOR CONDENSATE PUMPS

Since main condensate pumps for LNG carriers and the T/G condensate pumps are operated under very low NPSH conditions, a stainless-steel impeller (SCS14) is recommended at extra cost in order to avoid cavitation erosion.

■ BOILER FEED PUMPS FOR DIESEL VESSELS (Model: SHQ, SVQ, GHQ and DK80-4 & 100-4)

In case that the pH value of the handling liquid is above 8.5 for boiler feed pumps in diesel vessels, a material combination of a stainless-steel impeller (SCS13) and a ductile-cast-iron mouth ring (FCD700) should be fitted at extra cost in order to avoid alkaline corrosion.

■ CUSTOMER OPTIONS

The SHINKO standard centrifugal pumps have been designed and manufactured in accordance with the Japanese Marine Equipment Association's Standard as well as our specifications. However, the following items are open to be decided by customers during order specification:

1. Pump name (the standard name available based on the SM standard)
2. Quantity
3. Specification (capacity, total head, kind & temperature of handling liquid, electric source, and frequency)
4. With or without self priming device
5. Stuffing box seal (gland packing or mechanical seal)
6. Impeller material for continuous-use sea water pumps (phosphor bronze or stainless steel)
7. Type of spare parts (type 1 or type 3 based on the SM Standard)

Vertical single-stage single-suction upward-opening

SVA 300~600X DUCTILE CAST IRON (FCD400)

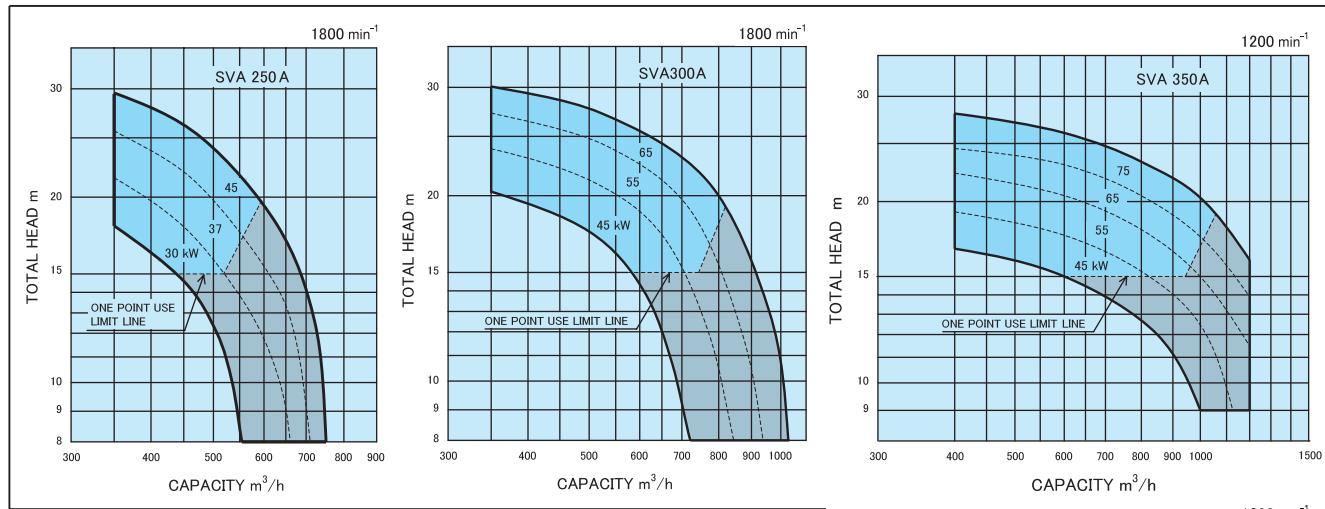

● PERFORMANCE CHARTS

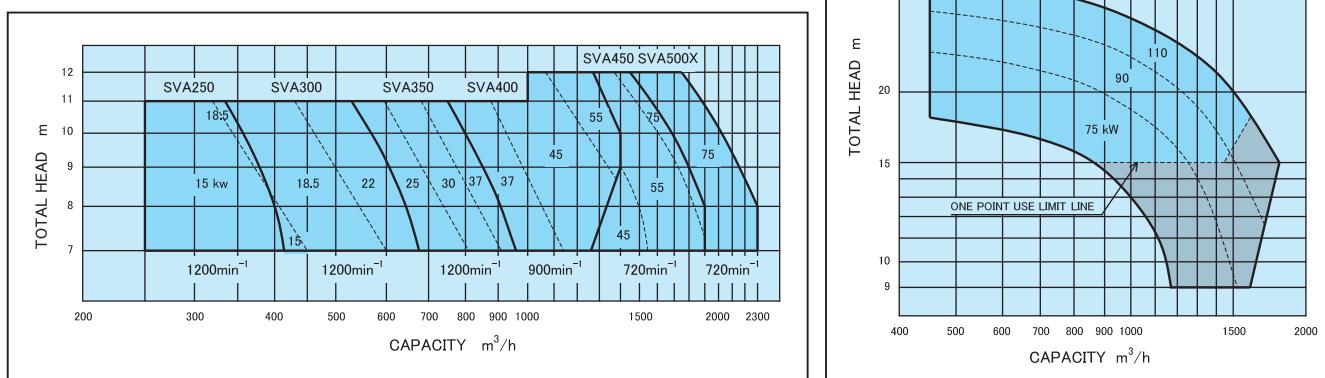

For Cooling Sea Water Pumps and Cooling Fresh Water Pumps (SVA)

For Cooling Sea Water Pumps and COPT Condenser Cooling Pumps with a Double Specification (SVA-A)
Pumps should be used intermittently when they are run in the gray-colored zones on the charts below.

For Turbo Generator Condenser Cooling Pumps (SVA)

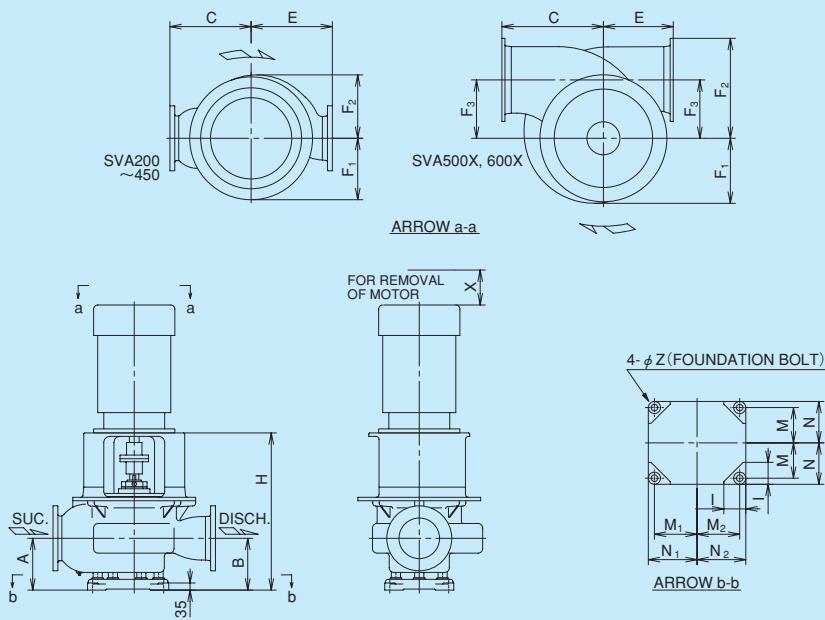

● STANDARD ACCESSORIES

Discharge pressure gauge	1
Suction compound gauge	1
Gauge board	1
Gauge root valve	2
Sealing pipe	1set
Air vent valve	1
Vacuum pump or Air ejector (for self priming device)	1set

● STANDARD SPARE PARTS

The number of each spare part is 1 set for all units of the same application and model.
Gland packing or mechanical seal
Coupling bolts & nuts (option)
Mouth rings (option)
Line bearing
Complete set of rotating element (option)

● PERFORMANCE CHARTS

When this model is used for pumps with a total head below 30m, such as air conditioning refrigerator cooling pumps, the revolution of the electric motor is 1800m^{-1} and the upper chart on the right should be referred to.

On the other hand, when this model is used for pumps with a total head over 30m, such as fresh water generator ejector pumps, the revolution of the electric motor is 3600m^{-1} and lower chart on the right should be referred to.

If the rated point is within the rating chart, even when the total head is between 20~30m, the lower chart on the right for 3600min^{-1} can also be used.

● STANDARD ACCESSORIES

Discharge pressure gauge	1
Suction compound gauge	1
Gauge stand	1
Gauge root valve	2
Air vent valve	1
Baseplate	1
Coupling cover	1
Vacuum pump or Air ejector (for self priming device)	1set

※If the total head is 130m or higher, the material of the volute casing and cover will be ductile cast iron (FCD400).

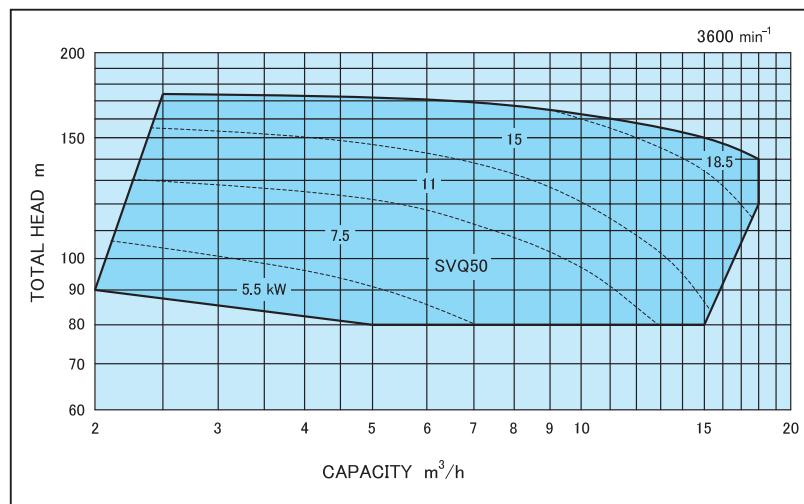

● PERFORMANCE CHART

The standard materials are used when the pH of the handling liquid is below 8.5.

When the pH is between 8.6~11, the liquid becomes alkaline and the following materials are used:

Impeller : Stainless steel (SCS13)

Mouth ring : Ductile cast iron (FCD700)

● STANDARD ACCESSORIES

Baseplate	1
Discharge pressure gauge	1
Suction compound gauge	1
Gauge board	1
Gauge root valve	2
Sealing pipe	1set
Air vent valve	1
Coupling cover	1

● STANDARD SPARE PARTS

The number of each spare part is 1 set for all units of the same application and model.

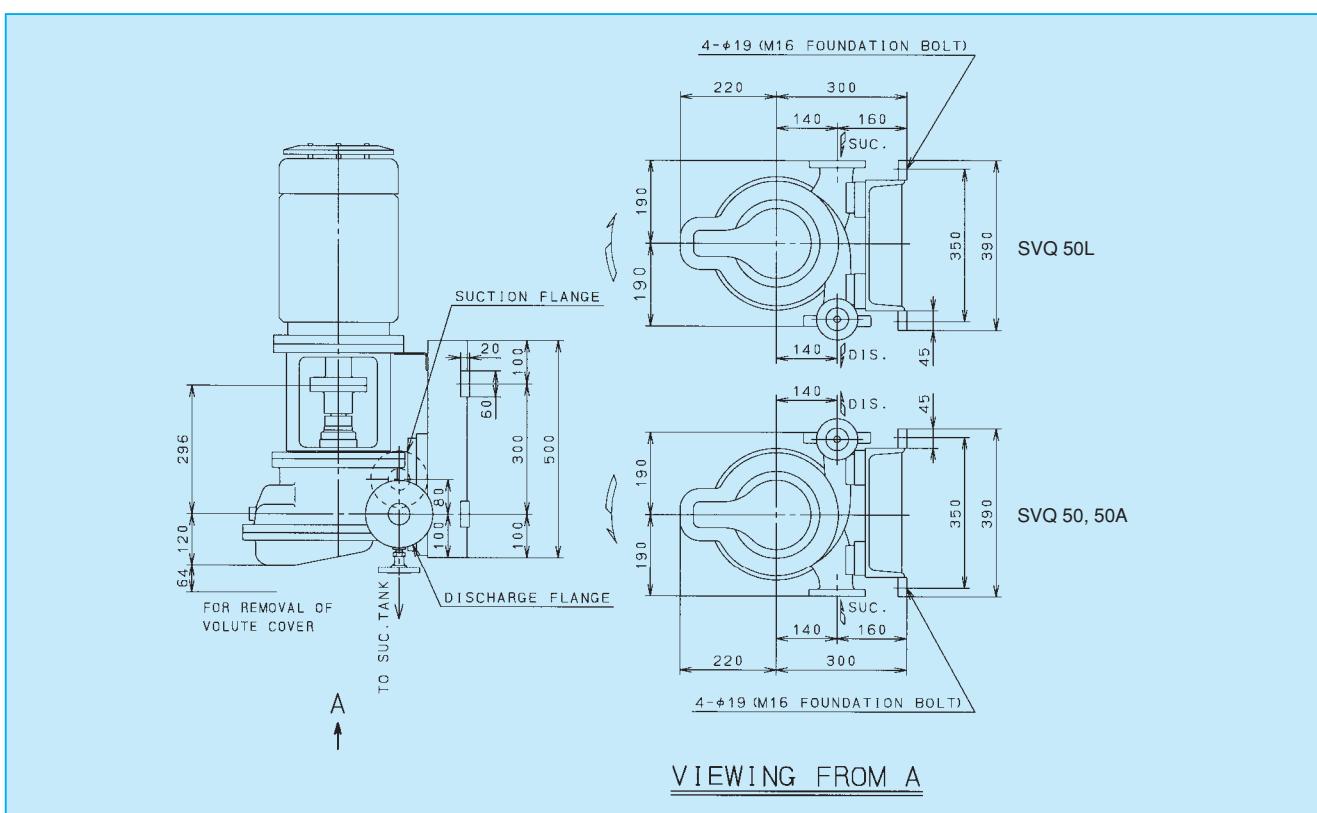

Gland packing or mechanical seal

Coupling bolts & nuts (option)

Mouth rings (option)

Casing ring (option)

Complete set of rotating element (option)

Note :

1. When attaching two pumps to the cascade tank wall, symmetrical pumps can be used.
2. SVQ 50 pumps can be used horizontally.

● PERFORMANCE CHART

The standard materials are used when the pH of the handling liquid is below 8.5.

When the pH is between 8.6~11, the liquid becomes alkaline and the following materials are used:

Impeller : Stainless steel (SCS13)

Mouth ring : Ductile cast iron (FCD700)

Casing ring : Ductile cast iron (FCD700)

● REQUIRED NPSH

● ANTI-OVER HEAT. CAPACITY

● STANDARD ACCESSORIES

Baseplate	1
Discharge pressure gauge	1
Suction compound gauge	1
Gauge stand	1
Gauge root valve	2
Air vent valve	1
Coupling cover	1
Minimum flow orifice	1

● STANDARD SPARE PARTS

The number of each spare part is 1 set for all units of the same application and model.

Gland packing or mechanical seal

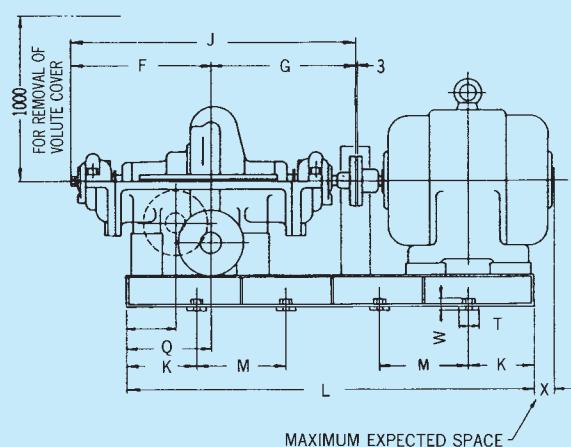

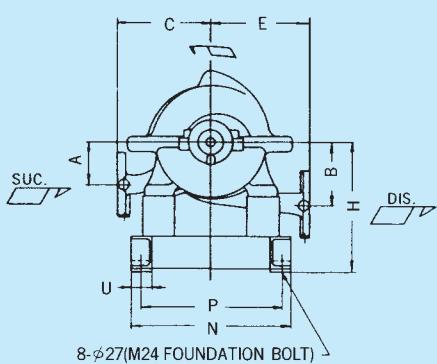

Ball bearings

Coupling bolts, nuts & rings (option)

Mouth rings (option)

Casing ring (option)

Complete set of rotating element (option)

Dimensions : mm

BOILER FEED PUMPS

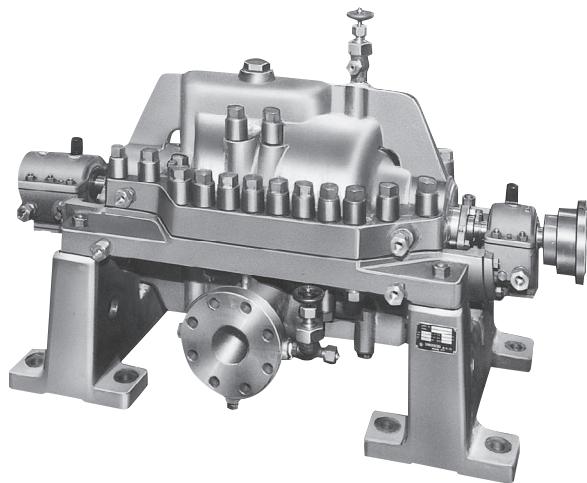

SHINKO
DK

● APPLICATIONS

Feed pumps for cargo boilers on diesel ships

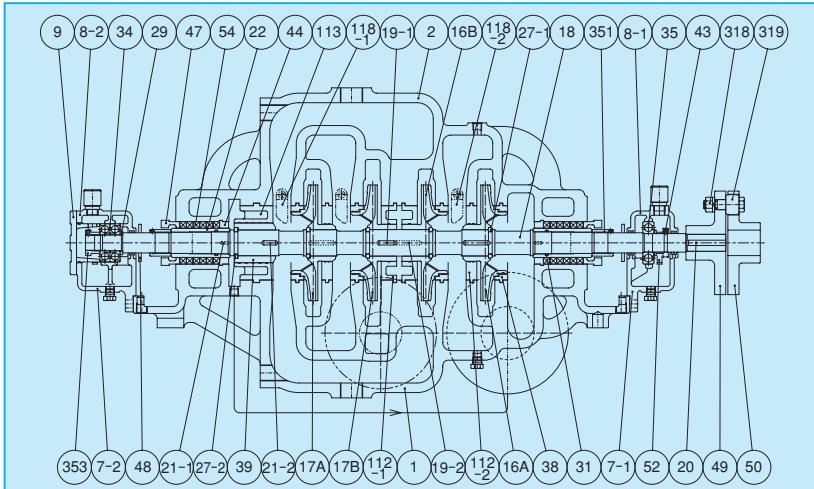

● GENERAL CHARACTERISTICS

Item	Model	DK 80-4	DK 100-4
Rotation	Clockwise when viewed from the driver		
Suction bore (mm)	100	125	
Discharge bore (mm)	80	100	
Ball bearings	7306 DB + 6307		
Service life (hr)	Abv. 60000		
Lubrication system	Oil ring		
LO required (ℓ)	0.7		
Stuffing box seal	Gland packing or Mechanical seal		
Weight : DCI (kg)	910	1100	
Water filled in casing (kg)	38	48	

● DESIGN & STANDARD MATERIALS

The casing is horizontally split. So, the rotating element can be overhauled without removing the suction and discharge piping.

● **STUFFING BOX SEALS**

A throttle bush has been equipped where the shaft passes through the casing. High temperatures and high water pressure are reduced when passing through the narrow clearance between the throttle bush and the shaft sleeve, and then they are led to the cascade tank. Additionally, a ring-shaped gland packing has been equipped on the outer side to prevent leakage.

● PERFORMANCE CHART

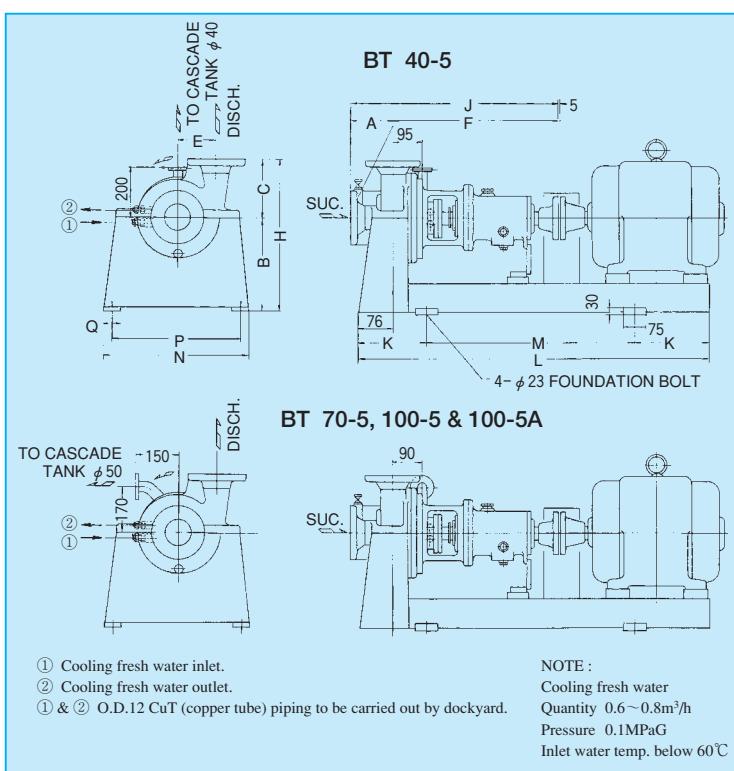

● STANDARD ACCESSORIES

Baseplate	1
Discharge pressure gauge	1
Suction pressure gauge	1
Gauge stand	1
Gauge root valve	2
Coupling cover	1

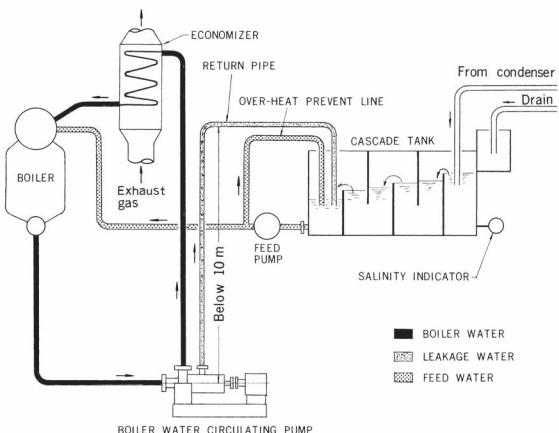

● STANDARD SPARE PARTS

The number of each spare part is 1 set for all units of the same application and model.

- Throttle bush (option)
- Ball bearings
- Mouth rings (option)
- Gland packing
- Neck bush (option)
- Coupling bolts, nuts & rings (option)
- Packing rings (option)
- Complete set of rotating element (option)

● WARNINGS FOR INSTALLATION

In order to maintain the pressure in the stuffing box under 0.1MPaG, the height difference between the pump and the cascade tank must be limited to 10m or less.

HYDROPHORE UNITS

[PATENT REGISTERED]

SHINKO
UH153L

● APPLICATIONS

Hydrophore units for drinking water and fresh water

● GENERAL CHARACTERISTICS FOR A COMBINED-TANK UNIT

Item	Model	UH 153L	
Kind of liquid		Fresh water	Drinking water
Tank volume (m ³)		1.0	0.5
Number of pumps supplied		2	1
Pump type	Vertical single stage centrifugal		
Capacity × head	5~15m ³ /h × 40~60m		
Pump suction bore (mm)	40		
Tank outlet bore (mm)	50		
Operating pressure range (MPaG)	0.3~0.55		
Effective water quantity in pressure tank (m ³)	0.3(on)~0.45(off)(MPaG)	0.050	0.188
	0.3 ~ 0.5 ~	0.062	0.230
	0.3 ~ 0.55 ~	0.070	0.258
	0.35 ~ 0.45 ~	0.033	0.125
	0.35 ~ 0.5 ~	0.046	0.171
	0.35 ~ 0.55 ~	0.054	0.212
Weight (kg)	1000		
Weight at service condition 0.5MPaG (kg)	2050		

On : pump starts, Off : pump stops

● DESIGN & STANDARD MATERIALS FOR HYDROPHORE UNIT

NO.	NAME OF COMPONENT	F.W. PUMP	D.W. PUMP	MATERIAL	
				NAME	JIS
1	TANK	1	1	STEEL	SS400
2	TANK COVER	1	1	〃	〃
3	CONNECTION PIECE	1	1	〃	SGP
4	DRAIN VALVE	1	1	BRONZE	CAC406

8	WATER LEVEL GAUGE	1SET	1SET	BRASS	C3602
9	PRESSURE SWITCH	1SET	1SET		
10	SAFETY VALVE	1SET	1SET	BRONZE	CAC406

- Note 1. One set of spare pump will be supplied.
2. *If fresh water is handled, cast iron is used. Whereas, if sea water is handled, bronze is used.

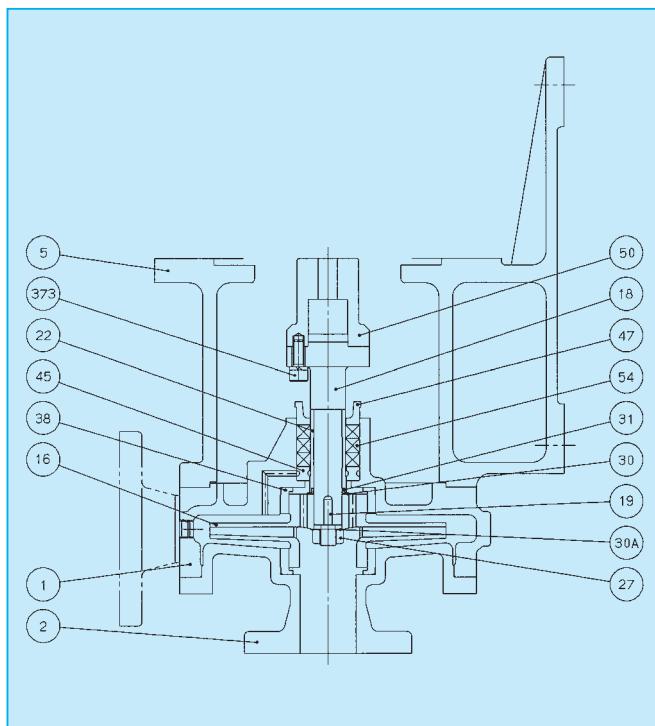

In order to conserve space in the engine room, this combined hydrophore tank is designed to integrate two tanks into one. The tank is separated horizontally by a dished-end plate. The lower side can hold 1m³ of fresh water and the upper can hold 0.5m³ of drinking water.

One fresh water pump and one drinking water pump have been simply installed on the combined tank. They are connected with the tank via a screw-down-check valve to supply the water.

Additionally, one spare pump with an electric motor has been installed on the tank simply. If either of the pumps malfunction, they can be replaced with this pump.

● PERFORMANCE CHART

The model RVZ50 is designed as a condensate pump for the generator turbine utilizing the exhaust gas of main diesel engine.

Since the casing can be split vertically, the rotating element can be overhauled without removing the suction and discharge piping.

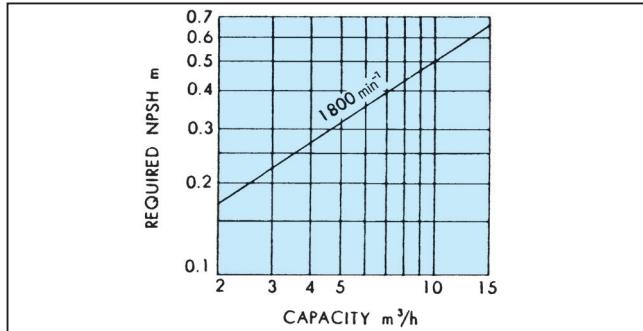

Moreover, this pump has a characteristic of low required NPSH.

CASCADE TANK UNITS

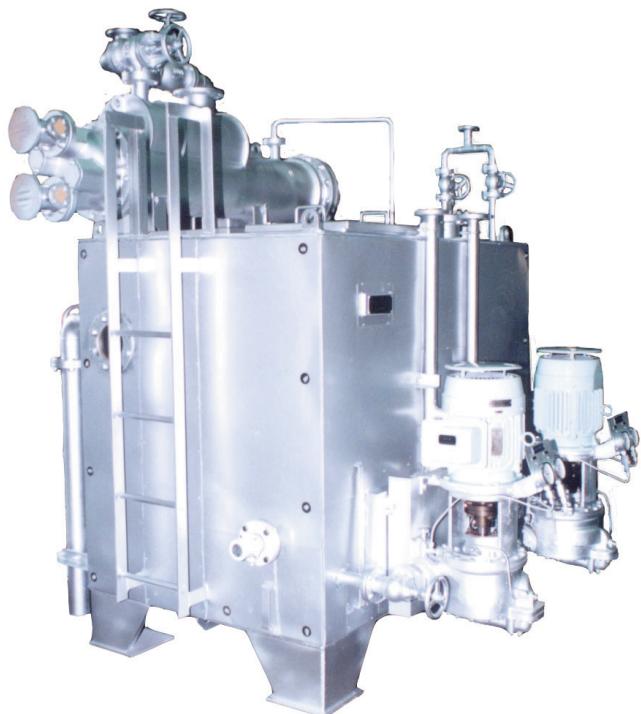

[PATENT REGISTERED]

SHINKO
UC

● APPLICATIONS

An atmospheric condenser and feed pumps are combined with the cascade tank as a single unit, which helps to minimize the installation space required.

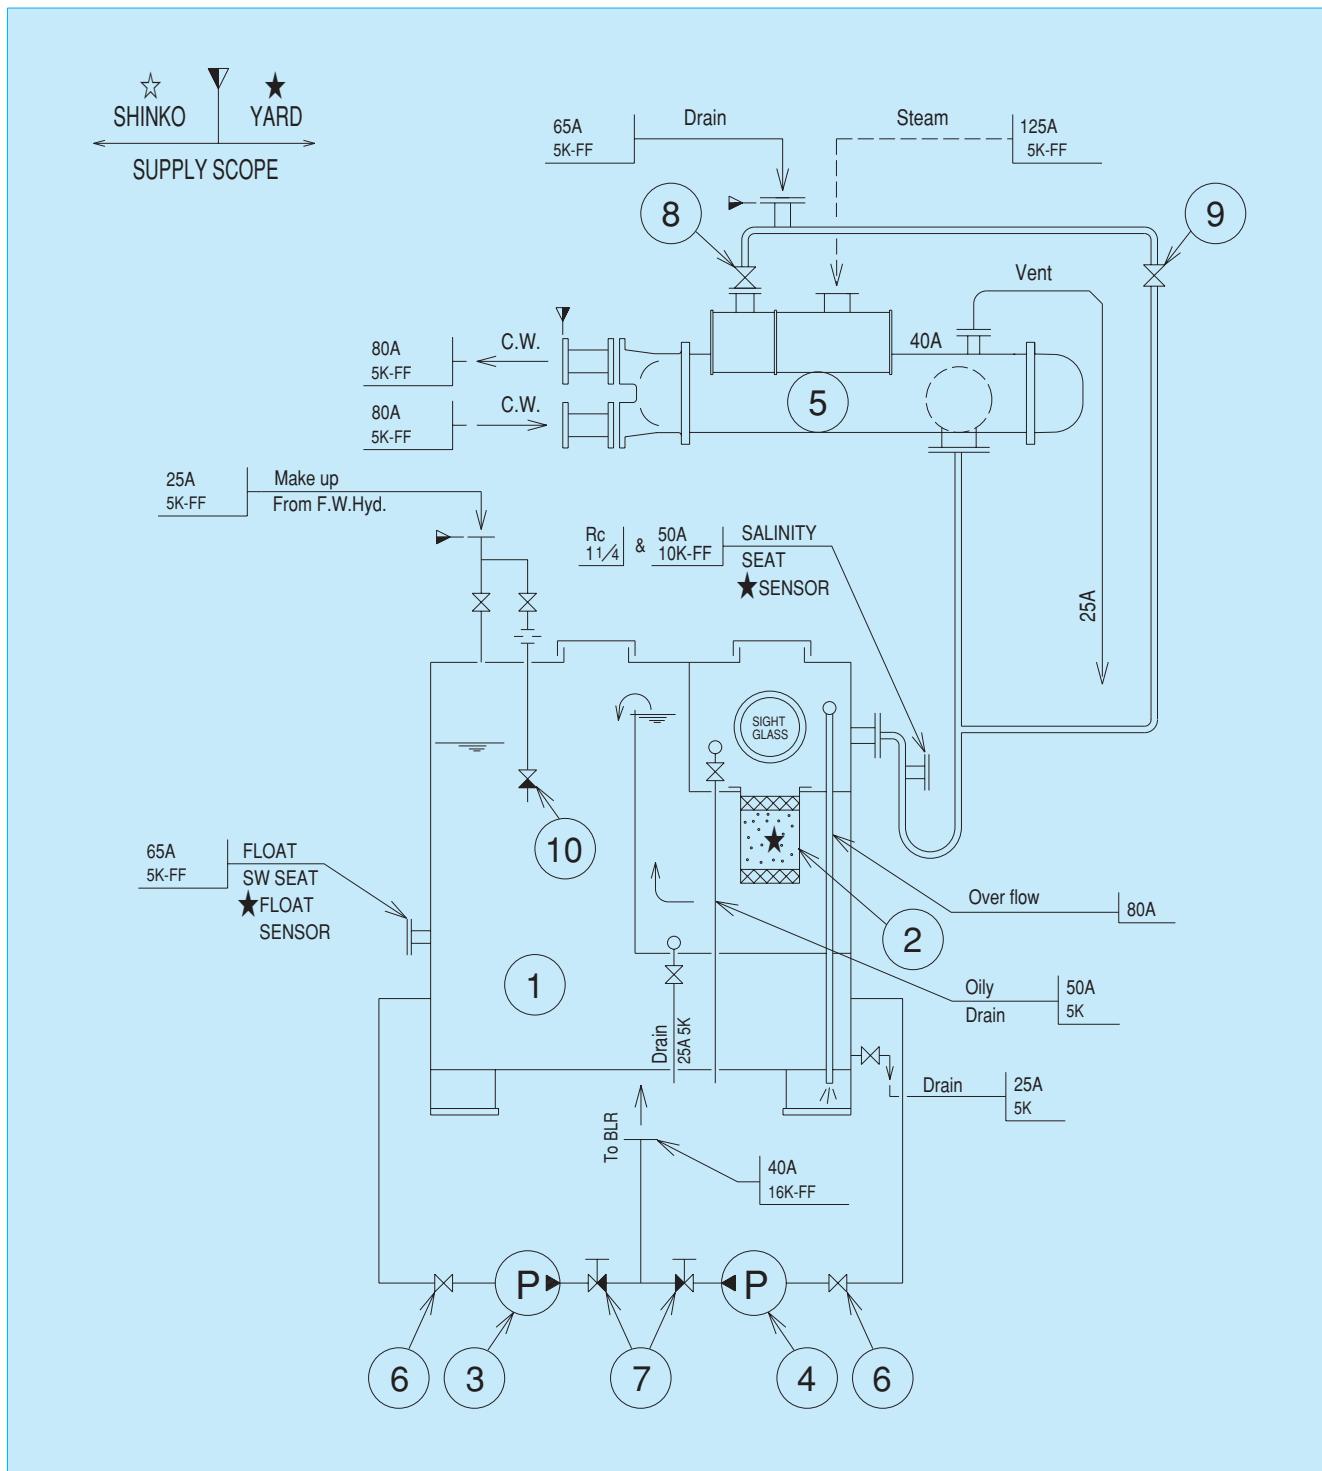

Wasted condensation water, which has heated up fuel oil for the main engine or other components, is led to the atmospheric condenser to be cooled. Then, the oil mixed in with the condensation water is removed with sponges in the buckets installed in the cascade tank. The clean water is fed to the auxiliary boiler via the feed pump.
